

SAFETY ALERT: High Slip/Trip Rate at Nairobi Depot

Week 7 | Issued by Paul Omondi

What's happening

This week's dashboard review shows Nairobi Depot has recorded 22 slip/trip incidents so far, the highest number of any site and incident type combination in the dataset. For comparison, the next highest site (Mombasa Depot) recorded 18 slip/trip incidents. Out of the 22 Nairobi cases, several took place on the transfer walkways connecting the loading bay to the main storage area, and most were logged during night shift hours (between 11pm and 6am), when lighting and general visibility on site are lower. A smaller number were also linked to wet flooring near the washdown area, which does not currently have anti-slip matting.

Why it matters

Slip and trip injuries are one of the most common causes of lost work time across our sites, and several of this week's cases were classified as having the potential to become more serious incidents if conditions are not corrected. Left unaddressed, the same hazards are likely to cause repeat incidents next week, particularly on night shift where fewer staff are on site to spot and report issues quickly.

What we need you to do

- " Before starting your shift, walk the transfer walkways and washdown area at Nairobi Depot and check for spills, clutter, or damaged flooring.
- " If you are on night shift, report any area with poor or broken lighting to your supervisor immediately, not at the end of the shift.
- " Wear the site-issued non-slip footwear at all times when moving through walkway and washdown areas.
- " Use a hazard tag to flag any slip risk on the spot rather than waiting for the next scheduled inspection.
- " Supervisors should confirm anti-slip matting has been requested for the washdown area by end of week.
